

Programme Overview

Climate change is now inevitable and beyond a shadow of doubt, the most pivotal and urgent predicament faced by the entirety of human race today. The issue has become a vital subject of concern, not only critical for action globally, but also at the national, sub-national and local scales. One of the great challenges for biology today is to try to understand how future changes in climate and will impact biological systems. Progress towards this goal depends on understanding how species respond to changes in climate.

Scientists at all levels, in response, are trying to address this acute issue through various means such as planning for adaptation and mitigation policies, supporting research, developing knowledge and infrastructure and other alternatives for training and capacity building.

We intend to have an integrative view of the impact of climate change by drawing a relationship between climate change and the dynamic state of the biological systems thereby its mitigation.
